5.

- A constructor is when you create a new object from scratch using a member or by setting new variables as its value.

- A destructor is when you destroy your existing object and every member and variables related to that object.

- A copy constructor is when you create a new object but with the data or parameters of an existing object. Basically a twin.

- A copy assignment constructor is when you replace an existing object's data with another data. Basically, you renew its identity.
